

### **ABSTRACT OF THE DISCLOSURE**

A device and arrangement for holding a flexible hose is provided. The hose has a holdable outer surface. The device for holding includes a holding portion with a holding area for an axial holding of the holdable outer surface of the flexible hose to maintain the axial position of a free end of the flexible hose and a support portion. The support portion has an inner side support area surrounding the flexible hose and extending towards the free end of the flexible hose. The support area has a trumpet-shaped extension having a radially widened outer end and radially narrowing as it extends continuously and uniformly towards the flexible hose and toward the holding element in order to protect an angular movable or sideways movement of the flexible hose.
